Quien soy

jooby.org
[@joobyproject](#)

- ❖ 15+ Software Engineer
- ❖ [@edgarespina](#)
- ❖ [J. Walter Thompson](#)
- ❖ [Java User Group Argentina](#)

Agenda

- ❖ Modules / Jigsaw
- ❖ Minor languages improvements
- ❖ New APIs and tools
- ❖ Future of Java

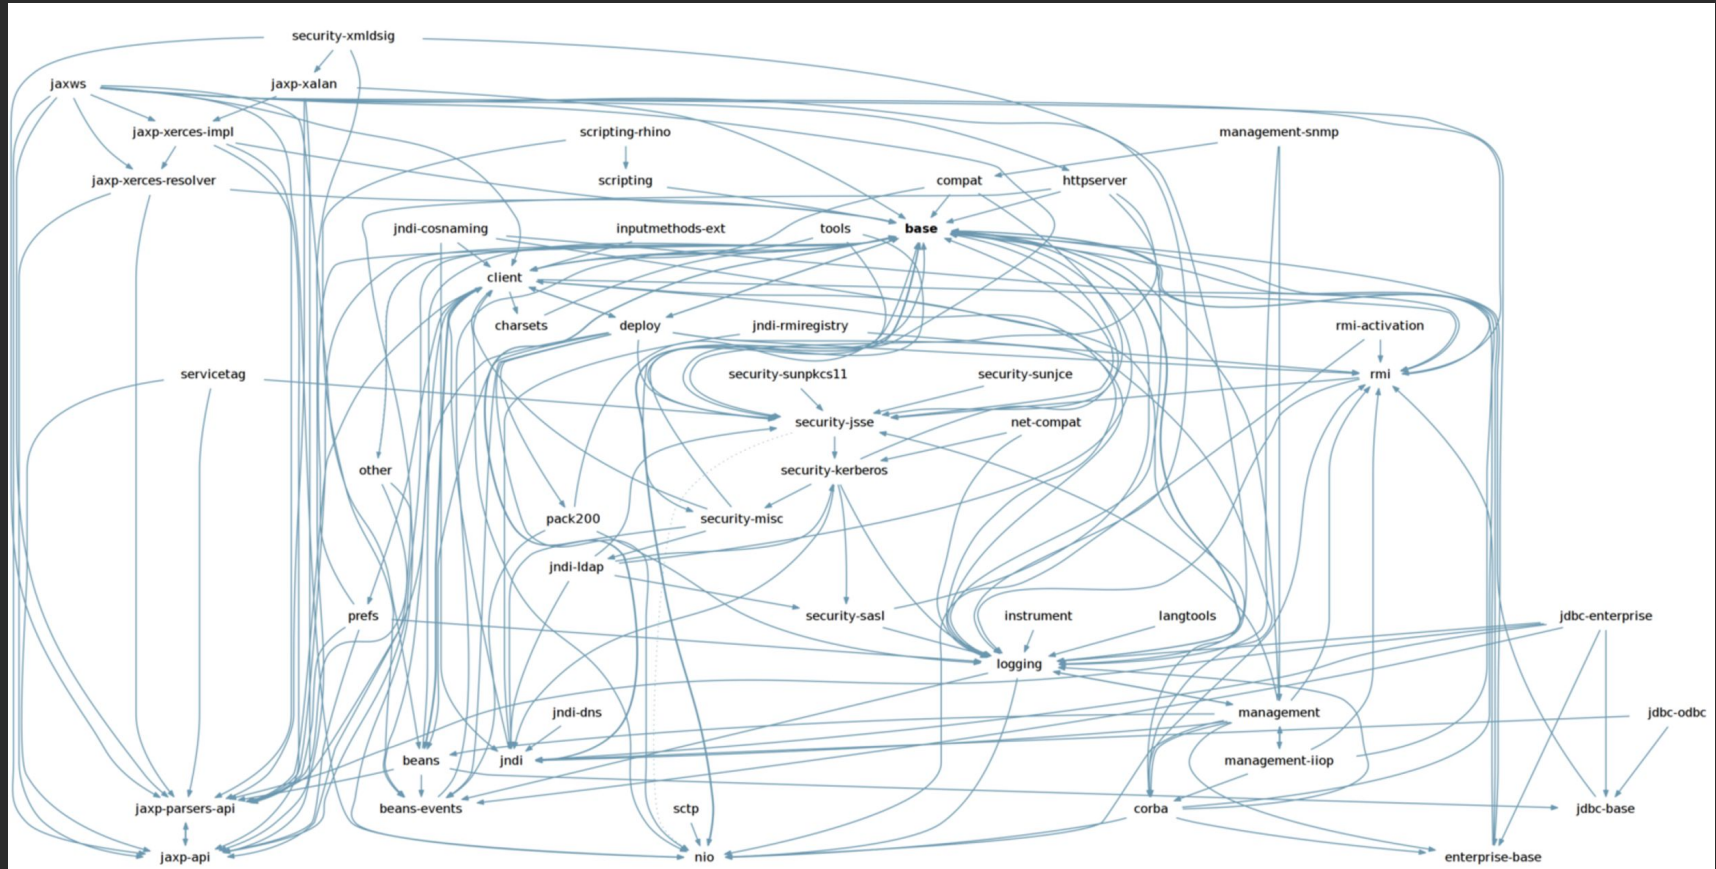

Jigsaw goal

- ❖ Strong encapsulation
- ❖ Loose coupling
- ❖ Modularity and dependency discover at compile time
- ❖ Modularize JDK
- ❖ Safe classpath (no classpath hell and shadowing of classes)
- ❖ Scalable runtimes for small devices

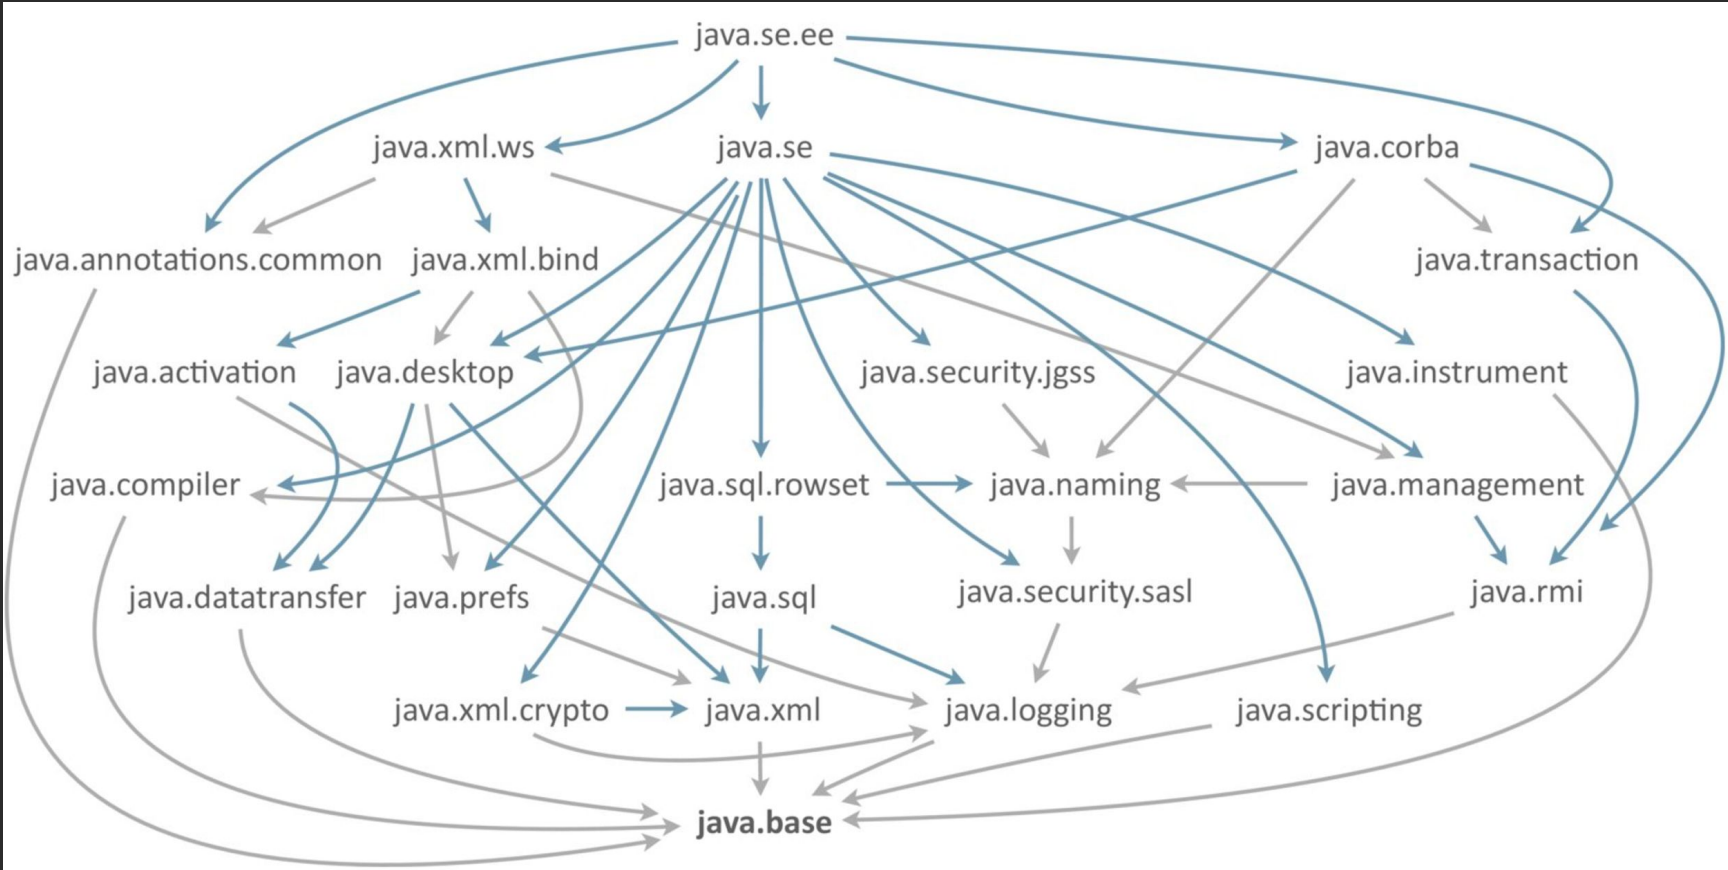

Jigsaw history

- ❖ 9-10 years of work (<https://mreinhold.org/blog>)
- ❖ Initially scheduled for JDK 7, JDK 8, JDK 9 (delayed twice)
- ❖ Release date: September 21th

Jigsaw: JDK back in 2010

Jigsaw: JDK today

Jigsaw: module

- ❖ Collection of packages
- ❖ Jar file with a module-info class file
- ❖ Accessible or required services and packages must be declared explicitly
- ❖ Compiled

Jigsaw: module-info.java

```
module meetup.hello {  
  
    exports meetup.hello;  
  
    provides meetup.hello.Service  
    |      with meetup.internal.hello.ServiceImpl;  
}
```

```
module meetup.app {  
    requires meetup.hello;  
  
    uses meetup.hello.Service;  
}
```

Jigsaw: running a module

- ❖ `java -p mod1.jar:mod2.jar -m mod/mainClass`
- ❖ `-p` or `--module-path` defines the module classpath
- ❖ `-m` defines the main class in a module
- ❖ still possible to use `-p` with `-cp`

Jigsaw: module types

- ❖ Application
 - `module-info.java`
- ❖ Automatic
 - no `module-info.java`, name is inferred from file name
- ❖ Unnamed
 - Every class defined via `-cp`
- ❖ Platform
 - JDK module, like `java.base`, `java.jdbc`

Jigsaw: jlink

- ❖ Application
 - `module-info.java`
- ❖ Automatic
 - no `module-info.java`, name is inferred from file name
- ❖ Unnamed
 - Every class defined via `-cp`
- ❖ Platform
 - JDK module, like `java.base`, `java.jdbc`

Jigsaw: (some) alternatives

❖ OSGi

- Powerful but complex
- Eclipse Equinox, Apache Felix, etc.
- Good documentation
- No compiler

❖ jboss-modules

- Base for Wildfly (jboss server)
- Easier than OSGi, still OSGi implementor
- No documentation
- No compiler

Jigsaw: migration

- ❖ Automatic and the unnamed module
- ❖ `java.lang.invoke.VarHandle` as alternative to `sun.misc.Unsafe`
- ❖ The big kill switch: `--permit-illegal-access` (only for 9, won't work on 10)
- ❖ `-m` defines the main class in a module
- ❖ still possible to use `-p` with `-cp`

jshell

- ❖ Finally a REPL console for Java
- ❖ Ideally for learn, test and fast-prototyping
- ❖ No need of Java file, compiler or IDE

Process API

- ❖ Portable process management API
- ❖ Current, children, spawned and system processes

```
ProcessHandle self = ProcessHandle.current();  
System.out.println(self.pid());
```

```
ProcessHandle.allProcesses()  
    .filter(ProcessHandle::isAlive)  
    .forEach(System.out::println);
```

StackWalker API

- ❖ Access to stack trace via StackWalker API
- ❖ No need to create an Exception

```
StackWalker.getInstance()  
    .walk(s -> s.limit(5))  
    .collect(Collectors.toList());
```

Minor changes

- ❖ Private method for interfaces
- ❖ Underscore for lambda arguments
- ❖ Publish/Subscribe API (Rxjava 2, Reactor)
- ❖ Immutable collection factory methods:
 - `List.of(1, 2, 3)`
 - `Set.of("a", "b", "c")`

Future of Java

- ❖ Type inference for local variables
 - `var foo = new Foo();`
- ❖ Data classes and Value Objects:
 - `value Point {int x; int y}`
- ❖ Pattern matching
